

ENGINEERING JUDGMENT SNAPSHOT

Student: Gourik Narendra Patil

Strongest Capability

Tracing downstream symptoms back to their source-of-truth origin and containing risk under pressure.

Weakest Capability

Initial debugging speed, because I sometimes jump to assumptions before gathering facts.

Repeated Behavioral Pattern

Across this week, I noticed that I tend to:

Successfully prioritize system safety when forced into a tradeoff, but I sometimes start investigations by reading code instead of checking runtime logs.

AI-Era Strength

When using or judging AI, I am strongest at:

Identifying unsafe architectural recommendations (like bad idempotency rules) and modifying them instead of blindly trusting the output.

Growth Gap

The engineering habit I need to build next:

Leading with evidence. I need to force myself to check logs and network tabs first before I even open the codebase.

Honest Self-Observation

Complete:

Under pressure, I tend to prioritize customer trust and system stability, even if it hurts short-term revenue.

I need to improve my initial incident response by looking at runtime evidence immediately instead of guessing.

30-Day Commitment

For the next 30 days, I will practice:

- Checking network requests before reading code.
- Pulling error logs as my absolute first step.
- Verifying database/cache state before forming hypotheses.
