

# FINAL OUTCOME TIER RECORD

Student: Gourik Narendra Patil

Final outcome tier:

- ☒ Strong Pass
- ☐ Pass
- ☐ Revision Required
- ☐ Incomplete

Outcome Evidence

| Capability        | Evidence Considered                                   | Outcome Note                                   |
|-------------------|-------------------------------------------------------|------------------------------------------------|
| Debugging         | Day 1 traced config mismatch using network tab        | Learned to follow facts over assumptions       |
| Systems reasoning | Day 2 identified cache poisoning over UI bugs         | Excellent separation of origin vs downstream   |
| Readiness         | Day 3 blocked launch until full workflow was verified | Strong adherence to checking the critical path |
| Ambiguity         | Day 4 built minimal safe v1 without notifications     | Delivered safely under undefined requirements  |
| AI judgment       | Day 5 rejected unsafe AI idempotency advice           | Outstanding boundary and safety awareness      |
| Pressure          | Day 6 prioritized customer trust over revenue         | Strong incident command under time pressure    |
| Defense           | Day 7 evidence-backed reflection and justification    | Clear tradeoff ownership and reasoning         |

Strongest Demonstrated Capability

Capability:

Systems Reasoning and Risk Containment

Evidence:

Across Days 4, 5, and 6, decisions were consistently focused on protecting data integrity and isolating failure boundaries rather than just masking symptoms or accepting unsafe architectures.

Required Growth Area

Growth area:

## Evidence-Driven Investigation

### Evidence:

On Day 1, initial time was lost assuming backend code issues before checking the network tab. Faster fact-gathering at the start of an incident would improve resolution speed.

### Final Student Summary

This outcome reflects strong growth in systems reasoning, risk assessment, and incident containment. Throughout the week, I learned to separate origin failures from downstream symptoms, challenge unsafe AI recommendations, and make hard tradeoffs under pressure. The biggest lesson was that customer trust and data correctness matter more than short-term speed or revenue. My next focus is building the habit of always gathering runtime evidence first to improve my initial debugging speed.
