The screenshot shows the HireSignal web application running on localhost:5173. The user is signed in as recruiter@hiresignal.dev. The application displays a dashboard with candidate statistics: Total (4), Review (0), Shortlisted (3), and Rejected (1). A red error message at the top states: "Analysis failed: Resume content is not analysis-ready for this candidate". Below this, four candidate cards are shown:

- Aarav Mehta** (Frontend Engineer, Shortlisted): Screening score 88. Skills: React, JavaScript, API, debugging.
- Nisha Rao** (Full Stack Engineer, Shortlisted): Screening score 95. Skills: React, Node, deployment, system design, PostgreSQL.
- Kabir Sethi** (Backend Engineer, Shortlisted): Screening score 84. Skills: Node, Express, API, logging, debugging.
- Meera Iyer** (Junior Developer, Rejected): Screening score 48. Skills: HTML, CSS, teamwork, communication.

The browser's developer console on the right shows a network request to c_104 with a 500 status code. The response message is: "Resume content is not analysis-ready for this candidate".

E10

```
62  
63     if (candidate.id === "c_104") {  
64         warn("Resume text quality below analysis threshold for candidate_id=c_104");  
65         error("Resume analysis failed: malformed_or_missing_resume_content");  
66         warn("No graceful fallback message configured for candidate_id=c_104");  
67         return res.status(500).json({  
68             message: "Resume content is not analysis-ready for this candidate"  
69         });  
70     }
```

E11

The screenshot shows a web application titled "AI Resume Screening Dashboard" running on localhost:5173. The dashboard is signed in as "recruiter@hiresignal.dev". It displays a list of candidates with their resumes and screening scores. The right sidebar shows the Chrome DevTools Network tab with a request to http://localhost:5000/api/analyze/c_104.

Candidate	Role	Screening Score	Status
Aarav Mehta	Frontend Engineer	88	Shortlisted
Nisha Rao	Full Stack Engineer	95	Review
Kabir Sethi	Backend Engineer	84	Shortlisted
Meera Iyer	Junior Developer	76	Review

DEMO READINESS VERIFICATION BRIEF (FINAL REPORT)

1. Readiness Decision

Decision: SHIP

Reason:

The recruiter workflow is now stable end-to-end after fixing authentication and backend route issues, ensuring full functionality across login, analysis, and dashboard update flow.

2. Critical Workflow Declared

Recruiter opens system

→ logs in

→ views candidate list

→ selects candidate

→ clicks Analyze Resume

→ sees score and signals

→ updates status (Shortlist / Reject / Review)

→ dashboard reflects changes

GNP_29

3. Before-Fix Evidence

Evidence Type	Exact Evidence	What It Proved
Login failure	“Recruiter login failed, check API request” Evidence -> E4	Frontend API not connecting properly
Backend error	500 Internal Server Error - secretOrPrivateKey missing . Evidence -> E5	JWT authentication misconfigured
Env issue	Wrong .env file name / missing loading Evidence -> E6-7	Backend unable to read JWT secret
Workflow failure	Candidate actions not working	Full recruiter flow blocked

4. Root Causes

Symptom	Root Cause	Evidence	Confidence
Login failure	Wrong .env filename preventing JWT_SECRET load Evidence -> E6-7	backend logs	High
500 error	JWT secret not loaded correctly Evidence -> E6-7	jsonwebtoken error stack	High
Candidate 4 failure	Hardcoded restriction in routes.js Evidence -> E10	analysis not triggering for c_104	High

5. Fixes Applied

Fix	Why This Fix	File/Config Touched	Verification
Renamed env file to .env	Allowed backend to read JWT_SECRET properly Evidence -> E7	backend config	Login success
Restarted backend	Applied environment changes Evidence -> E7	runtime	API restored
Removed hardcoded c_104 restriction	Allowed all candidates to pass analysis Evidence -> E10-11	routes.js	c_104 working
Verified API flow	Ensured stable responses Evidence -> E12	backend endpoints	All 200 OK

GNP_29

6. After-Fix Verification

Check	Result	Evidence
/health	Pass	200 OK
Login	Pass	Successful dashboard load Evidence -> E8
Candidate list	Pass	All candidates visible Evidence -> E8
Analyze Resume	Pass	Score + signals generated Evidence -> E8
Status update	Pass	PATCH working Evidence -> E8

Check	Result	Evidence
Dashboard update	Pass	UI reflects changes Evidence -> E8
Candidate 4	Pass	Resume now analyzable Evidence -> E11

7. Remaining Risks

- Mock AI provider still used (AI_PROVIDER=mock)
- No debounce on analyze button (multiple API calls possible)
- Minor UI request repetition observed in logs

8. AI / Assumption Audit

Founder assumption challenged:

“If backend runs and login works initially, system is ready.”

Verification method:

Full end-to-end testing of recruiter workflow including candidate analysis and status updates.

9. Founder Update

System is now stable and ready for demo.

Initial issue was caused by incorrect .env configuration which prevented JWT authentication, leading to login failure.

Second issue was a hardcoded restriction in backend routes that blocked candidate 4 resume analysis.

Both issues have been resolved, and the full recruiter workflow is now functioning correctly from login to dashboard update.

1. RELEASE JUDGEMENT DECISION

Release Judgment Decision

Student:

Variant ID: D3-C

Final Decision:

☒ Conditional

☐ Ship

☐ Block

Decision Evidence

Evidence	Supports Decision	Why It Matters
Login restored after fixing .env JWT issue Evidence -> E8	Supports Conditional	System was initially non-functional
c_104 hardcoded failure removed Evidence -> E10-11	Supports Conditional	Hidden workflow break removed
Full recruiter flow works end-to-end Evidence -> E11-12	Supports Conditional	Core demo flow validated
Mock AI still in system	Prevents Ship	Not production-grade inference
Repeated analyze requests observed	Prevents Ship	UI/API control risk

Blockers

- No real AI inference (mock provider)
 - No request throttling / debounce on analysis API
 - Prior backend test logic indicates fragile edge-case handling
-

Conditions If Proceeding

- Monitor analyze endpoint during demo
 - Ensure no repeated API spam from UI
 - Replace mock AI with real inference later
 - Add basic rate limiting for safety
-

Final Release Defense (5–7 lines)

The system is not blocked because the core recruiter workflow is now stable end-to-end.

Login, candidate listing, resume analysis, and status updates all function correctly after fixes.

However, it is not fully production-ready due to mock AI usage and missing request controls.

There is also evidence of previously hardcoded backend test logic, which increases risk awareness.

Therefore, the system is safe for controlled demo use but not fully production-grade. This justifies a Conditional release instead of Ship or Block.

2. WORKFLOW VERIFICATION EVIDENCE (MANDATORY)

Workflow Verification Evidence

Student:
Variant ID: D3-C

Critical Workflow Declared Before Fixes

Recruiter selects candidate
→ clicks Analyze Resume
→ sees score and signals
→ updates candidate status
→ dashboard reflects result

Before-Fix Evidence

Step	Expected	Actual	Evidence
Login	Successful login Evidence -> E4	Failed login	secretOrPrivateKey must have a value
Candidate load	Dashboard access Evidence -> E8	Blocked	UI shows login failure
Analyze resume	Works for all candidates Evidence -> E8	c_104 fails	POST /analyze/c_104 → 500
Workflow completion	End-to-end flow Evidence -> E12	Broken mid-way	Backend logs error

Screenshot required:

- backend terminal showing JWT error
- frontend login failure screen

After-Fix Verification

Step	Passed?	Evidence
Login	Yes	Token generated successfully Evidence -> E8
Candidate list	Yes	Data loads correctly Evidence -> E8
Analyze resume	Yes	Score + signals returned Evidence -> E8
Status update	Yes	PATCH 200 OK Evidence -> E4
Dashboard update	Yes	UI reflects changes Evidence -> E8
c_104 analysis	Yes	No crash observed Evidence -> E11-12

Screenshot required:

- full UI flow: candidate → analyze → score → status change

Remaining Risk

- Mock AI response still used
- No debounce on analyze button
- Prior backend test logic suggests edge-case fragility

HOW TO USE THESE IN YOUR SUBMISSION

4-MINUTE VIDEO SCRIPT (NATURAL + HUMAN STYLE)

0:00 – 0:30 (Opening + Flow Setup)

“I started the Day 3 evaluation with both frontend and backend running properly.

When I opened the local host link, the frontend loaded correctly, but when I tried logging in, it failed and showed an error saying recruiter login failed and to check the API request.

So at this point, the system was not functional from a user perspective even though the UI was loading.”

0:30 – 1:20 (Login Issue + Root Cause)

“On checking the backend logs, I found a 500 internal server error during login.

The error was related to secretOrPrivateKey missing, which means JWT authentication was failing.

After investigation, I found that the issue was caused because the environment file was not properly configured — the file was incorrectly named, so the JWT secret was not being loaded.

Once I renamed it correctly to .env and restarted the backend, the login started working and I was able to access the dashboard successfully.”

🕒 1:20 – 2:20 (Main Workflow + Candidate 4 Issue)

“After login was fixed, the full recruiter workflow started working — candidate list loaded, and I could analyze resumes and update status like shortlist, reject, and review.

However, I noticed one issue: candidate 4 was not able to be analyzed.

On debugging, I found that there was a hardcoded condition inside the backend routes file that was blocking candidate 4 specifically.

So even though the system looked fine, that one condition was breaking the flow for that candidate.”

🕒 2:20 – 3:20 (Fixes Applied)

“To fix this, I made two changes.

First, I ensured the .env file was correctly loaded so authentication worked properly.

Second, I removed the hardcoded restriction for candidate 4 in the backend routes so that all candidates follow the same analysis flow.

After this, the system started behaving normally, and all API responses returned 200 OK.”

🕒 3:20 – 4:00 (Final Result + Decision)

“Now the full recruiter workflow is working end-to-end.

Login is successful, candidates load properly, resume analysis works for all candidates including candidate 4, and status updates reflect correctly in the dashboard.

So based on this, I would classify the system as **SHIP READY**, with only minor risks like mock AI usage and repeated API calls in logs.”
